

Support Systems

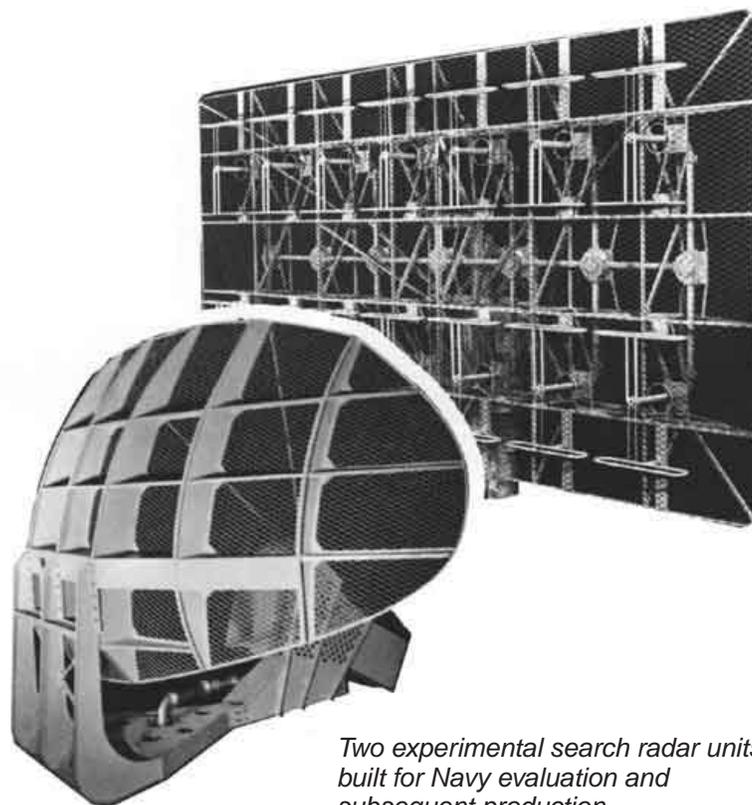

A live storage Palletflo similar to several Navy installations for first-in, first-out handling of pallet loads.

Transflo is the heart to the first automatic two-way strapping system for crates and pallet loads at a Navy depot.

Karry-All accepts, transports and discharges crated or skidded loads up to 7 1/2 tons in seconds; all functions are driver controlled. The cab swings to side permitting head-in approach to loading dock. Truck deck elevates to match conveyor on the dock. Conveyorized truck deck discharges half of full load. Deck also tilts for gravity discharge. Travel is at highway speeds.

Two experimental search radar units built for Navy evaluation and subsequent production
